1. The setting and introduction **1**

2. Location analysis for industry and service trades: comparative cost and other approaches **7**

2.0 Introduction 7
2.1 Industry location principles and the comparative cost approach 8
2.1.1 Locational analysis for the iron and steel industry 10
2.1.2 Analysis of the aluminum industry, and energy and other location factors 14
2.2 Service trades location principles 21
2.3 Spatial and location measures 24
2.3.1 The location quotient 24
2.3.2 The coefficient of localization 26
2.3.3 The localization curve 27
2.4 Geographic information systems (GIS) 31
2.5 Concluding remarks 35
Endnotes 36
References 37

3. Regional and interregional input-output analysis 41

3.0 Introduction 41
3.1 A single region 43
3.1.1 The statistical framework: input-output accounts 43
3.1.2 Technical coefficients and the input-output model 49
3.1.3 Input-output analysis 52
3.2 Two or more regions: the interregional input-output (IRIO) system 70
3.2.1 The statistical framework: interregional input-output accounts 70
3.2.2 Technical and trade coefficients in the IRIO model 74
3.2.3 Input-output analysis with the IRIO model 76
3.3 Two or more regions: the multiregional input-output (MRIO) system 81
3.3.1 The statistical framework: multiregional input-output accounts 81
3.3.2 Input-output analysis with the MRIO model 85
3.4 Constructing models from less than perfect data sets 86
3.4.1 Survey-based tables 86
3.4.2 Nonsurvey-based tables 87
3.4.3 Hybrid tables 93
3.4.4 Interregional connections 93
3.4.5 Empirical implementation 94
3.5 Fusion of comparative cost and input-output: editorial remarks 95
Appendix 3.1 The commodity-industry approach in input-output models 98
Appendix 3.2 Additional linkage measures from input-output data 102
Appendix 3.3 Data for the two-region IRIO numerical example 104
Appendix 3.4 The RAS approach to updating or regionalization of input-output tables 104
Endnotes 109

Mathematical appendix. Elements of matrix algebra 125

4. Regional and spatial econometric analysis 135

4.0 Introduction 135

4.1	Econometric models and their uses	138
	4.1.1 The basic structure	138
	4.1.2 Three typical applications	139
4.2	Some underlying statistical theory	144
	4.2.1 Desirable properties of estimators	144
	4.2.2 Ordinary least squares (OLS) estimators	148
	4.2.3 Assumptions of OLS estimators	151
	4.2.4 Other estimators	154
4.3	Some problems of estimation	157
	4.3.1 Specification errors	157
	4.3.2 The expected value of the error term is not equal to zero	167
	4.3.3 The variance of the error term is not constant	169
	4.3.4 Correlated error terms	173
	4.3.5 Stochastic explanatory variables, multicollinearity, and measurement errors	180
4.4	Other relevant econometric models	183
	4.4.1 The use of dummy variables	183
	4.4.2 Discrete choice models	185
	4.4.3 Pooled time-series and cross-section models	187
	4.4.4 Simultaneous equations models	191
4.5	Spatial econometrics	196
	4.5.1 Spatial dependence	197
	4.5.2 Spatial heterogeneity	198
4.6	The 'art' of econometric model building	199
4.7	Fusion of econometrics and input-output: some editorial remarks	201
Endnotes		203
References		208
5. Programming and industrial and urban complex analysis		**211**
5.0	Introduction	211
5.1	A simple linear programming problem: a graphic solution	213
5.2	Basic aspects of nonlinear programming	220
	5.2.1 Introduction of multiple types of constraints	222
5.3	Industrial complex analysis as interregional programming	225
5.4	Urban and other complexes	235
5.5	Concluding remarks	238
Endnotes		239

References 240

6. Gravity and spatial interaction models 243

6.0 Introduction 243
6.1 A simple probability point of view 244
6.2 Definition and measurement of mass 250
6.3 Definitions and measures of distance 253
6.4 Functional forms for spatial separation 253
6.5 Constrained gravity (spatial interaction) models 257
6.6 Calibration, tests and applications of spatial interaction models 263
6.6.1 The use of OLS (ordinary least squares) to test the effect of distance, cooperation and hostility upon trade of nations 264
6.6.2 The use of maximum likelihood in a policy oriented application with particular attention to characteristics of origins, destinations and types of distance (separation) measures 269
6.7 Conclusion 272
Endnotes 273
References 277

7. Social accounting matrices and social accounting analysis 281

7.0 Introduction 281
7.1 The overall conceptual framework 283
7.2 Classification and disaggregation of accounts 293
7.2.1 Production activities cum commodities 294
7.2.2 Institutions 294
7.2.3 Factors of production 296
7.3 Data requirements in the construction of a SAM 298
7.4 SAM multiplier analysis and extensions 300
7.4.1 Unconstrained multipliers 300
7.4.2 Constrained multipliers 306
7.4.3 Structural path analysis and transmission of economic influence within the SAM framework 308
7.4.4 SAM as the foundation of computable general equilibrium models 316
7.5 Studies and applications based on the SAM 317

7.5.1 General overview 317
7.5.2 National applications 318
7.5.3 A regional-interregional application: the two-region Indonesian SAM for 1980 323
7.5.4 A village application: impact of rural industrialization on village life and economy: a comparison of two Indian village SAMs 325
Endnotes 326
References 328

8. Applied general interregional equilibrium 333

8.0 Introduction 333
8.1 A highly simplified model introducing distance and transport inputs as basic variables 336
8.1.1 The consumption subsystem 337
8.1.2 The production subsystem 337
8.1.3 The transport subsystem 338
8.1.4 The market subsystem 339
8.2 Transport inputs, location and trade in a two-country world 343
8.2.1 The consumption subsystem 345
8.2.2 The production system 345
8.2.3 The transport subsystem 346
8.2.4 The market subsystem 346
8.2.5 The location problem in an applied general interregional equilibrium framework 349
8.2.6 Some concluding remarks 351
8.3 The scaffolding of a core social accounting matrix for an applied general interregional equilibrium (AGIE) model 351
8.3.1 Trade in a two country/three region world: the scaffolding of an interregional (international) input-output core 351
8.3.2 Extensions to obtain the scaffolding of a core social accounting frame: a top-down approach 359
8.3.3 Extensions and generalizations to a multi-region, multi-country world 366
8.3.4 Extensions with a bottoms-up approach to AGIE models 367
8.3.5 The exploration of a Financial SAM and its fusion with a Real SAM 369

8.4 Problems and questionable character of the basic assumptions of standard applied general equilibrium models 373
8.4.1 Problems in representing the consumption subsystem 373
8.4.2 Questionable character of the production subsystem 376
8.4.3 Problems regarding scale economies in the transport and production subsystems, externalities, and market imperfections 378
8.4.4 Questionable character of intertemporal analysis 379
8.4.5 Problems of capturing behavior of governments, the Rest of the World and feedback sequences 380
8.4.6 Non-economic factors and other structural shortcomings 381
8.5 Some seminal contributions by regional scientists to the development of an applied general interregional (AGIE) model for a pure space economy 383
8.6 Concluding remarks 386
Appendix 8.1 The basic functions, exogenous magnitudes, variables and equations of the two nation/three region model 387
Endnotes 390
References 397

9. Interregional and spatial microsimulation 401

9.0 Introduction 401
9.1 Basic features of microsimulation 402
9.2 Likely extensions, costs, and other limiting factors in microsimulation 405
9.3 Applications 407
9.3.1 Wealth in the United States: family stock ownership and accumulation, 1960–1995 407
9.3.2 The potential of microsimulation for urban models 410
9.4 Concluding remarks 415
Endnotes 415
References 417

10. New channels of synthesis: the fusion of regional science methods **419**

10.0 Introduction 419
10.1 Location analysis for industry and service trades and its fusion with input-output, econometrics and programming 420
10.2 Channel II. Social accounting analysis and its fusion with applied general interregional equilibrium analysis and other methods 425
10.3 Channel III. Methods for analyzing urban and metropolitan processes 433
10.3.1 Fusion centering around gravity and gravity-type models 434
10.3.2 Fusion centering around urban complex analysis 438
10.4 Channel IV. On comprehensive syntheses and conflict management 441
10.5 Conclusion 457
Appendix: Tables of pairwise comparison and relative weights 458
Endnotes 460
References 462
