"Drawing on both detailed historical scholarship and a refreshing geographical sensibility, *Wired into Nature* provides a unique and important perspective on the vast strategic, ecological, and cultural impact of North America's first electrical information network. James Schwoch brings important questions of environment, indigeneity, and surveillance back into the story of the telegraph, in a sweeping narrative that connects the mapping and exploitation of the American West to the development of the White House Situation Room. A must-read for students of our contemporary information society."
